Got to then search in the search bar

Then click on management

then click on terminal icon

then run ls command enter

Then run cd t1 enter

Then run python t1.py enter

Than go to the setting type icon they have setup name click on them than got to the

Developer console click on them go to the file

Click on them than choose open file click double click one them I have created 2 files click on any one of them than click on debug click on open Execute Anonymous Windows than right if the

File is LinearSerch right in the apex code is

LinearSerch.demo(1);

Then tick ✔this type of tick on open log then

Execute then tick on Debug Only

Same setup

For Stud file only syntax is changed in apex code is

Stud.main(); 👍
